Efficiency in the smallest space

DRYPOINT® M PLUS, the all-in-one solution for filtration and drying
Drying | DRYPOINT® M PLUS

Two in one: the successful concept of DRYPOINT® M PLUS

The most important objective in compressed-air processing is to remove contaminations and humidity from the compressed air. The condensation of water in compressed air systems causes corrosion, promotes the growth of micro-organisms and represents a permanent danger to the operating procedure. Compressed air with a high content of humidity can lead, for example, to a breakdown of the pneumatic controls, to increased wear and tear or to other failures in the production process.

High performance demands
The demands on the degree of drying (pressure dew point) vary depending on the application. However, they should always be met with the lowest possible use of energy. In addition, the dry compressed air must be immediately available.

The precondition for this is a finely graded range of products and the know-how of the manufacturer regarding the performance characteristics of the dryers under widely differing operating conditions. The solution: DRYPOINT® M PLUS made by BEKO TECHNOLOGIES.

Demand-oriented and energy-efficient
DRYPOINT® M PLUS membrane dryer with an integrated nanofilter is the innovative solution for efficient filtration and drying in one housing. It offers reliable compressed-air drying with low purge air demands, requires no electric energy and contains no environmentally harmful desiccants. The integrated nanofilter increases the quality of the dried compressed air and the reliability and long-term stability of the highly selective hollow-fibre membranes. The high-capacity DRYPOINT® M PLUS is even suitable for the processing of breathing air.

Drying and filtering in new dimensions

With the integration of a compressed-air filter and a membrane dryer in one housing, the DRYPOINT® M PLUS offers highest safety and flexibility to the user. Thanks to its compact construction type, the device is suitable for use with widely differing space requirements. The performance of the membrane dryer made by BEKO TECHNOLOGIES with its wide drying spectrum makes it attractive for versatile tasks. In extensive compressed air systems with central processing, DRYPOINT® M PLUS can also be employed where additional compressed-air processing is required as a result of demanding plant technology, for example for point-of-use drying at decentralised supply points. With the corresponding prefiltration, the employment directly downstream of oil-lubricated compressors is also possible. DRYPOINT® M PLUS is particularly easy to maintain and needs no electric energy.

Compressed air of highest quality

Depending on the volume flow, pressure, size and purge-air setting, pressure dew points down to -40°C are achieved with the DRYPOINT® M PLUS. The compressed air corresponds to the quality requirements of ISO 8573-1.
The right turn: the operating principle of the DRYPOINT® M PLUS

In the DRYPOINT® M PLUS compressed-air membrane dryer, the air is dried according to the physical principle of the partial vapour pressure compensation of water vapour through diffusion. This is particularly efficient and energy-saving thanks to the patented TWIST 60 technology of BEKO TECHNOLOGIES. The special winding method of the fibres in the membrane element leads to optimum flow conditions at a lower construction height and reduces the purge air demand. The filter element directly upstream of the hollow-fibre membranes offers effective protection against aerosols and particles.

1. The compressed air flows into the core tube of the membrane dryer.

2. In the filter element, it is diverted; filtered compressed air enters the hollow fibres of the membrane element.

3. The purge air required for drying is continuously diverted in the outlet zone of the membrane element and is atmospherically expanded through a defined nozzle opening. This purge air is significantly drier due to the expansion, as the humidity contained in the compressed air is now distributed to a multiple of volume. The dry purge air is led via the outside of the membrane fibres.

4. Two air flows with different moisture contents move in a reverse current through the membrane element, only separated by the membrane wall. The humid compressed air flows in the hollow-fibre membranes, and the dry purge air flows outside. As a result of the different moisture contents, the humidity diffuses from the compressed air into the purge air. The drying process is highly efficient thanks to the controlled winding of the membrane fibres, the TWIST 60 technology.

5. The dry compressed air leaves the membrane element.

6. The humid purge air is released into the environment.
You do not always need a constant flow of dry compressed air. In such instances, the purge air means that compressed air is used unnecessarily. Thanks to the DRYPOINT® M PLUS’s purge air barrier, purge air is only used when dried compressed air is needed as well.

As a result, the DRYPOINT® M PLUS provides greater energy efficiency and cuts down on the cost of generating compressed air.

**DRYPOINT® M PLUS with purge-air shut-off option for increasing energy efficiency.**

**DRYPOINT® M PLUS as an FDR unit**

The FDR unit is a compact combination that consists of a Filter, Dryer and Pressure regulator. It is the perfect solution for terminal applications. The FDR unit comes fully assembled and just needs to be connected to the compressed air line.

**The advantages at a glance**

- Compact Plug & Play solution
- Pressure regulator 4 – 10 bar for constant pressure at the point of use
- Optionally available with an additional activated carbon filter for reducing oil vapours
In use everywhere: DRYPOINT® M PLUS

DRYPOINT® M PLUS is available in several sizes, for different drying degrees, and is equipped with a float drain. Depending on the volume flow, pressure, size and purge-air setting, standard pressure dew points of down to 40°C are achieved. Customer-specific designs, e.g. for lower pressure dew points, are possible at any time.

### Operating conditions DRYPOINT® M PLUS

Membrane dryers for higher pressures and temperatures upon request.

Please feel free to avail yourself of our professional expertise, e.g. for a design to fit any other conditions. We would be happy to advise you.
**The DRYPOINT® M PLUS advantages at a glance**

- All-in-one: filtration and drying in one housing
- Twist 60 technology for highest efficiency
- Integrated condensate drain
- Optimum filtration directly upstream of the membrane
- No change in the compressed-air composition / temperature
- Easy filter element replacement
